

Project Title: Evaluation of herbicides for quackgrass control in winter wheat

Principal Investigator: Bob Stougaard

Project personnel: Brooke Bohannon

Objectives: To evaluate newer herbicides for control of quackgrass

Results:

This study was established on October 2, 2013 using "Clearstone" winter wheat. Quackgrass was seeded on October 11 after the winter wheat had become established. A factorial treatment design was used which consisted of two herbicides (Beyond and Varro) applied at three timings. Quackgrass failed to become established and the study was abandoned.
